

# OzTAM Quarter Hour Audience Data Files

Each day, OzTAM delivers Quarter Hour audience data files for the five metropolitan city markets and the national STV market for the trading databases.

The Quarter Hour data files provide the average fifteen-minute Overnight and Consolidated 7 audience estimates by channel for each quarter hour in a research day (24 hours between 2am to 2am).

The Overnight Quarter Hour audience data files containing the Overnight audience estimates are released each day for the previous research day.

After seven days, when the Time Shift to 7 audience data is available, the Consolidated 7 Quarter Hour audience data files for that research day are released.

The OzTAM quarter hour files deliver over 150 demographic groups for use within planning and trading systems for each of the five metropolitan total television markets and the national subscription television market.

Following a review of the available quarter hour demographic groups by industry representatives with OzTAM, almost two thirds were identified as being typically used or considered for use.

While the sample sizes for almost all the identified demographics are over 100 within each market, OzTAM recommends caution when using smaller demographic groups since the sampling variability for the audience estimates will be larger. OzTAM encourages users of the quarter hour data to consider using larger demographic groups and averaging estimates across broader day parts and over a longer time period.

The Quarter Hour files include a specific set of trading demographic groups as listed below.

## OzTAM Quarter Hour Audience Data Files

Each day, OzTAM delivers Overnight and Consolidated 7 Quarter Hour processed audience data files for the five metropolitan city markets as well as for the national STV market.

The Quarter Hour audience data files supply fifteen-minute average audience estimates for a specific set of trading demographic groups for use within planning and trading systems.

As is the case for all sample-based research, audience estimates for demographic groups with smaller sample sizes will have larger sampling variability.

When analysing audience estimates for a particular demographic group, it is important to allow for the influence of sampling variation as well as other key factors influencing people's viewing behaviour, such as the weather, channel programming changes, promotional activity, major world events and increasing media channel options.

As such, OzTAM advises users of OzTAM data to account for the sample sizes for the selected demographic group, and to apply caution for demographic groups with small sample sizes, particularly when sample sizes are near or below 100.
